Semantic Segmentation

Run “fully convolutional” network
to get all pixels at once

Smaller output
due to pooling

Semantic Segmentation

Semantic Segmentation

Problem: convolutions at original image resolution is very expensive!

Semantic Segmentation

Design network as a bunch of convolutional layers, with **downsampling** and **upsampling** inside the network!

Semantic Segmentation

Design network as a bunch of convolutional layers, with **downsampling** and **upsampling** inside the network!

Downsampling:
Pooling, strided
convolution

Upsampling:
???

In-Network upsampling: Unpooling

Nearest Neighbor

1	2
3	4

1	1	2	2
1	1	2	2
3	3	4	4
3	3	4	4

Input: 2 x 2

Output: 4 x 4

“Bed of Nails”

1	2
3	4

1	0	2	0
0	0	0	0
3	0	4	0
0	0	0	0

Input: 2 x 2

Output: 4 x 4

In-Network upsampling: Max Unpooling

Max Pooling

Remember which element was max!

1	2	6	3
3	5	2	1
1	2	2	1
7	3	4	8

Input: 4 x 4

5	6
7	8

Output: 2 x 2

...

Rest of the network

Max Unpooling

Use positions from pooling layer

1	2
3	4

Input: 2 x 2

0	0	2	0
0	1	0	0
0	0	0	0
3	0	0	4

Output: 4 x 4

Corresponding pairs of downsampling and upsampling layers

Learnable Upsampling

Normal 3X3 convolution, stride 1 and pad 1

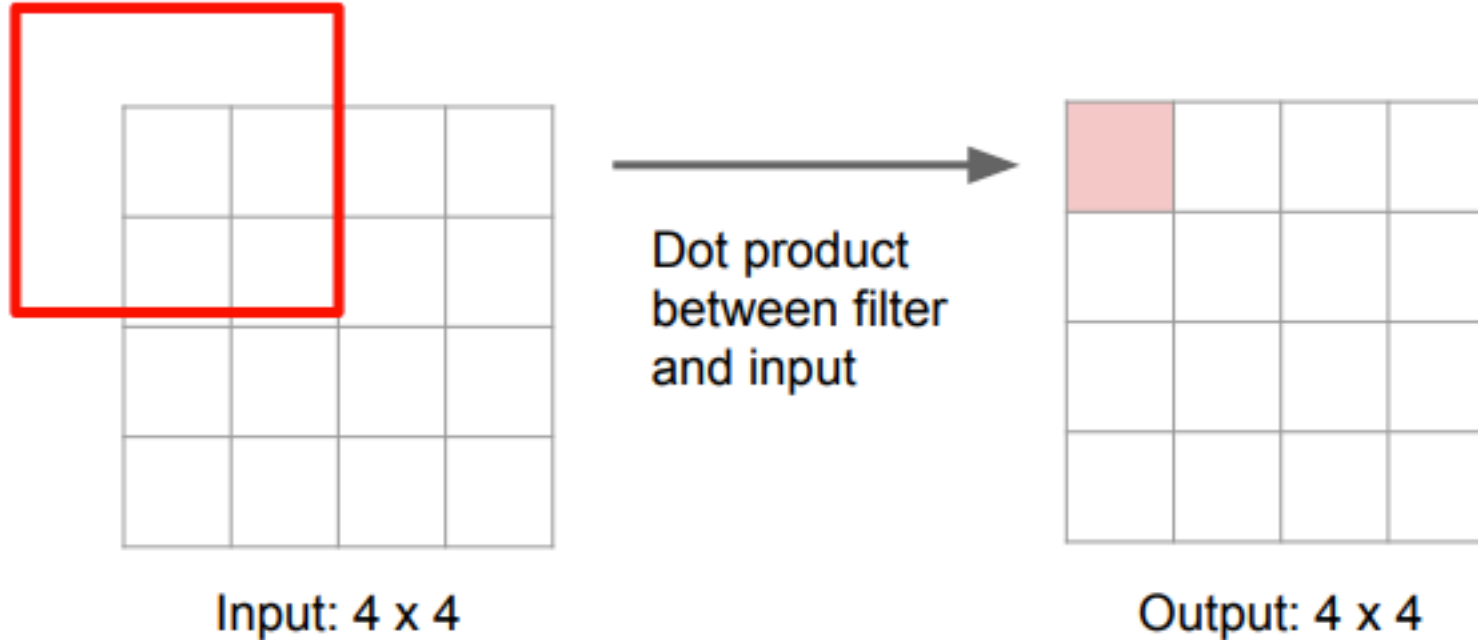

Input: 4 x 4

Output: 4 x 4

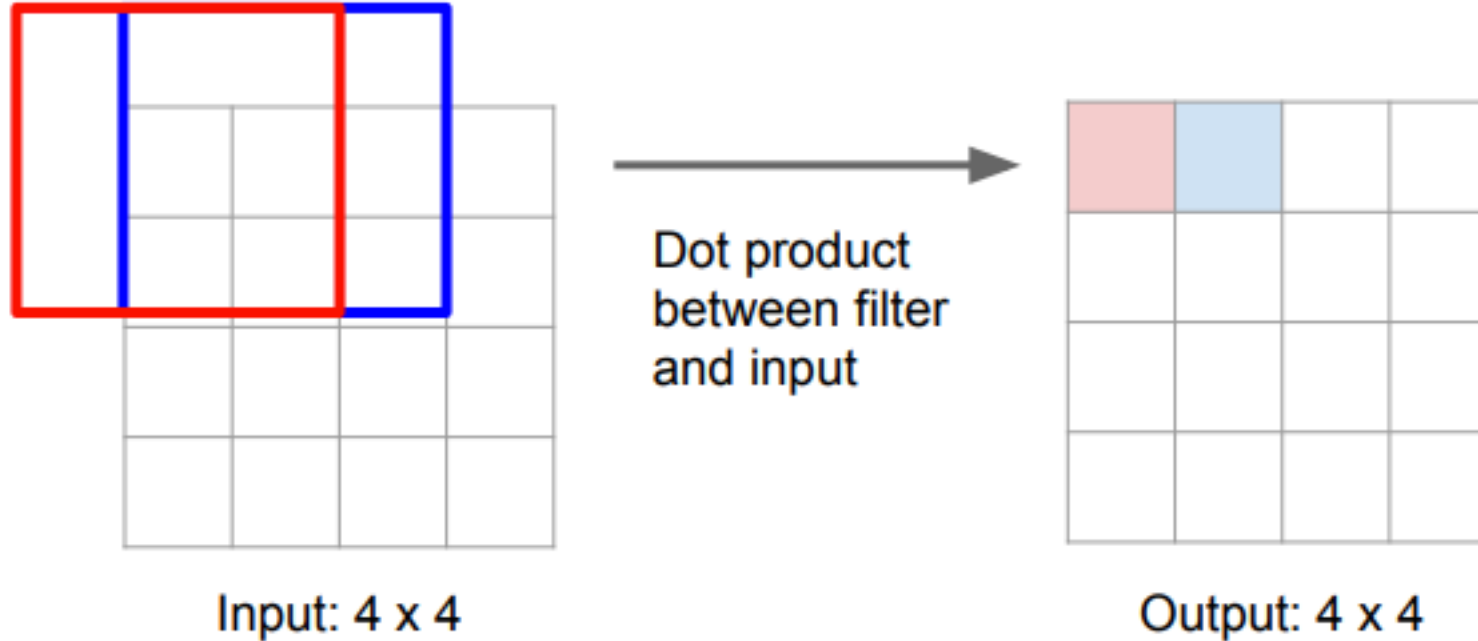

Learnable Upsampling

Normal 3X3 convolution, stride 1 and pad 1

Learnable Upsampling

Normal 3X3 convolution, stride 1 and pad 1

Learnable Upsampling

Normal 3X3 convolution, stride 2 and pad 1

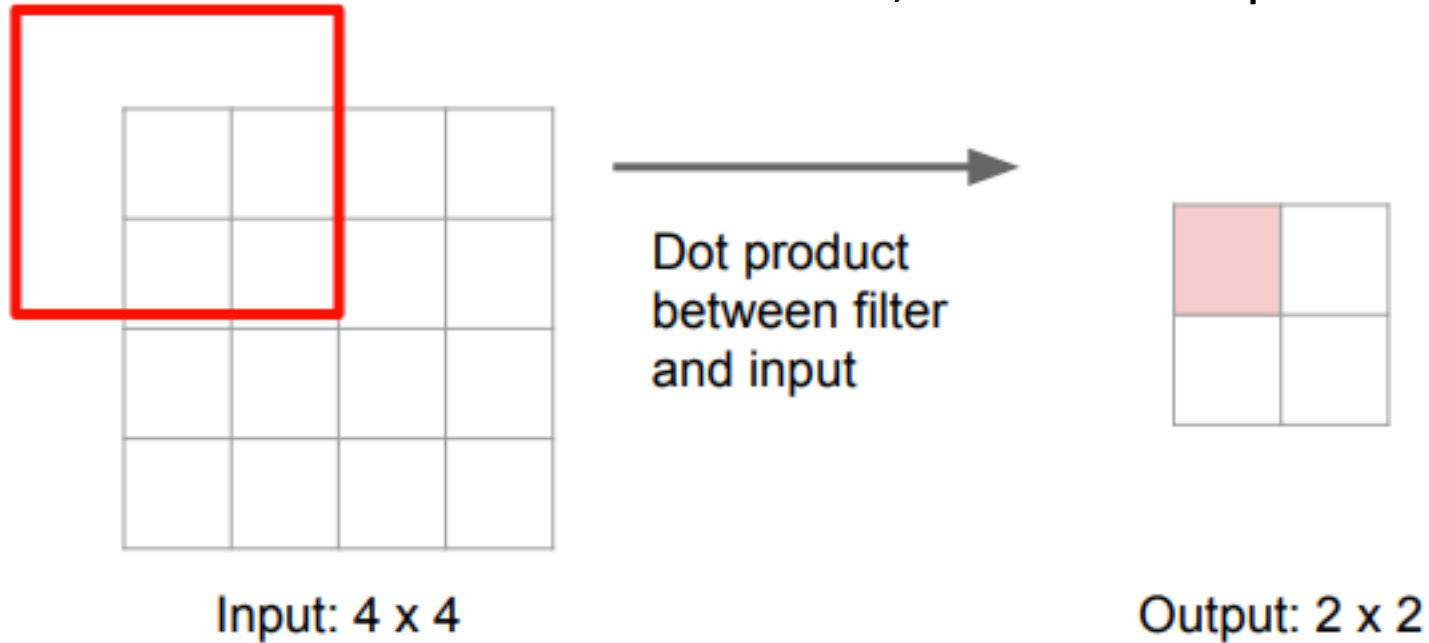

Input: 4 x 4

Output: 2 x 2

Learnable Upsampling

Normal 3X3 convolution, stride 2 and pad 1

Learnable Upsampling

Normal 3X3 convolution, stride 2 and pad 1

Input: 4 x 4

Dot product
between filter
and input

Output: 2 x 2

Filter moves 2 pixels in
the input for every one
pixel in the output

Stride gives ratio between
movement in input and
output

Transposed Convolutions

Transposed Convolutions are used to upsample the input feature map to a desired output feature map using some learnable parameters.

The basic operation that goes in a transposed convolution is explained below:

1. Consider a 2x2 encoded feature map which needs to be upsampled to 3x3 feature map.

Input

0	1
2	3

Figure 7. Input Feature Map

Output

Figure 8. Output Feature Map

3. Now we take the upper left element of the input feature map and multiply it with every element of the kernel as shown in figure 10.

0	0	0
0	0	

Figure 10.

2. We take a kernel of size 2x2 with unit stride and zero padding.

Kernel

0	1
2	3

Figure 9. Kernel of size 2x2

4. Similarly, we do it for all the remaining elements of the input feature map as depicted in figure 11.

Input	Kernel																																													
<table><tr><td>0</td><td>1</td></tr><tr><td>2</td><td>3</td></tr></table>	0	1	2	3	<table><tr><td>0</td><td>1</td></tr><tr><td>2</td><td>3</td></tr></table>	0	1	2	3	<table><tr><td>0</td><td>0</td><td></td></tr><tr><td>0</td><td>0</td><td></td></tr><tr><td></td><td></td><td></td></tr></table> + <table><tr><td></td><td>0</td><td>1</td></tr><tr><td></td><td>2</td><td>3</td></tr><tr><td></td><td></td><td></td></tr></table> + <table><tr><td></td><td></td><td></td></tr><tr><td>0</td><td>2</td><td></td></tr><tr><td>4</td><td>6</td><td></td></tr></table> + <table><tr><td></td><td></td><td></td></tr><tr><td></td><td>0</td><td>3</td></tr><tr><td></td><td>6</td><td>9</td></tr></table>	0	0		0	0						0	1		2	3							0	2		4	6						0	3		6	9
0	1																																													
2	3																																													
0	1																																													
2	3																																													
0	0																																													
0	0																																													
	0	1																																												
	2	3																																												
0	2																																													
4	6																																													
	0	3																																												
	6	9																																												

5. As you can see, some of the elements of the resulting upsampled feature maps are over-lapping. To solve this issue, we simply add the elements of the over-lapping positions.

Input	Kernel													Output																																																		
<table><tr><td>0</td><td>1</td></tr><tr><td>2</td><td>3</td></tr></table>	0	1	2	3	<table><tr><td>0</td><td>1</td></tr><tr><td>2</td><td>3</td></tr></table>	0	1	2	3	=	<table><tr><td>0</td><td>0</td><td></td></tr><tr><td>0</td><td>0</td><td></td></tr><tr><td></td><td></td><td></td></tr></table>	0	0		0	0					+	<table><tr><td></td><td>0</td><td>1</td></tr><tr><td></td><td>2</td><td>3</td></tr><tr><td></td><td></td><td></td></tr></table>		0	1		2	3				+	<table><tr><td></td><td></td><td></td></tr><tr><td>0</td><td>2</td><td></td></tr><tr><td>4</td><td>6</td><td></td></tr></table>				0	2		4	6		+	<table><tr><td></td><td></td><td></td></tr><tr><td></td><td>0</td><td>3</td></tr><tr><td></td><td>6</td><td>9</td></tr></table>					0	3		6	9	=	<table><tr><td>0</td><td>0</td><td>1</td></tr><tr><td>0</td><td>4</td><td>6</td></tr><tr><td>4</td><td>12</td><td>9</td></tr></table>	0	0	1	0	4	6	4	12	9
0	1																																																															
2	3																																																															
0	1																																																															
2	3																																																															
0	0																																																															
0	0																																																															
	0	1																																																														
	2	3																																																														
0	2																																																															
4	6																																																															
	0	3																																																														
	6	9																																																														
0	0	1																																																														
0	4	6																																																														
4	12	9																																																														

Learnable Upsampling

3 x 3 **transpose** convolution, stride 2 pad 1

Input: 2 x 2

Output: 4 x 4

Transposed Convolution

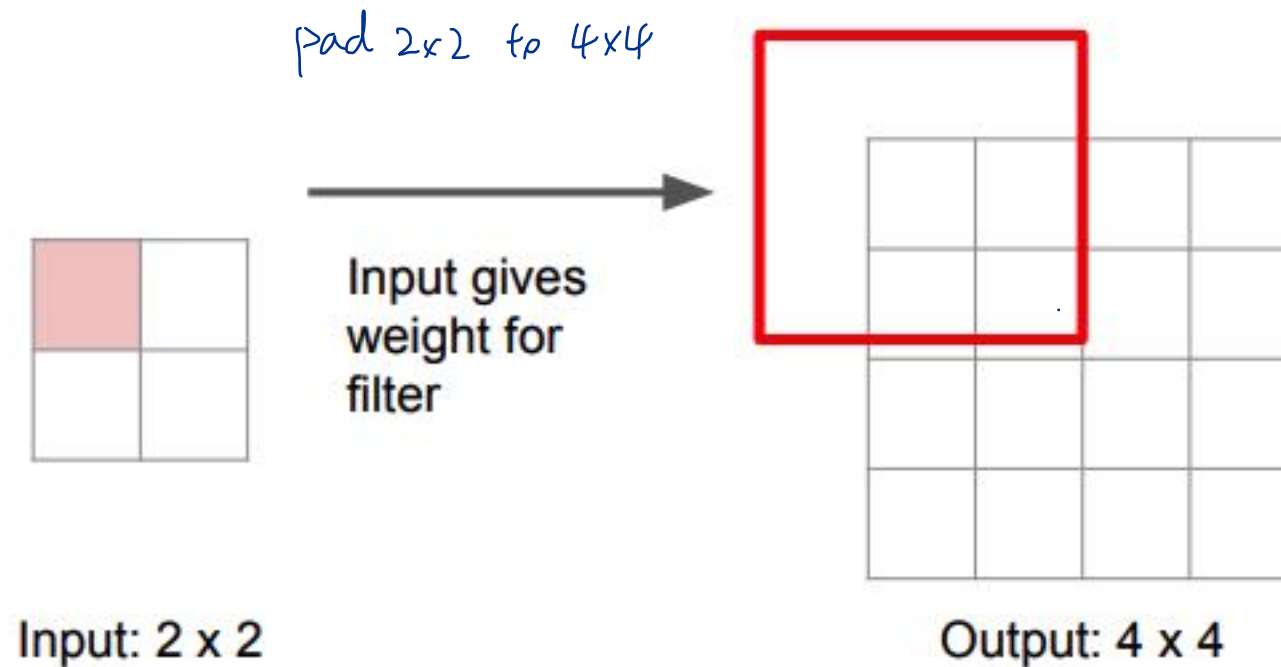

Sometimes referred to as deconvolution but that is not correct terminology.

有时称为反卷积，但这不是正确的术语

a	b	c	d	e
f	g	h	i	j
k	l	m	n	o
p	q	r	s	t
u	v	w	x	y

Learnable Upsampling

3 x 3 **transpose** convolution, stride 2 pad 1

Learnable Upsampling

3 x 3 **transpose** convolution, stride 2 pad 1

Input: 2 x 2

Input gives
weight for
filter

Output: 4 x 4

Filter moves 2 pixels in
the output for every one
pixel in the input

Stride gives ratio between
movement in output and
input

Learnable Upsampling

3 x 3 **transpose** convolution, stride 2 pad 1

Input: 2 x 2

Input gives
weight for
filter

Output: 4 x 4

Sum where
output overlaps

Filter moves 2 pixels in
the output for every one
pixel in the input

Stride gives ratio between
movement in output and
input

Learnable Upsampling

Other names:

- Deconvolution (bad)
- Upconvolution
- Fractionally strided convolution
- Backward strided convolution

3 x 3 **transpose** convolution, stride 2 pad 1

Input: 2 x 2

Input gives
weight for
filter

Output: 4 x 4

Sum where
output overlaps

Filter moves 2 pixels in
the output for every one
pixel in the input

Stride gives ratio between
movement in output and
input

Learnable Upsampling: 1D Example

Convolution as Matrix Operation

Convolution as Matrix Operation

Convolution as Matrix Operation

Transpose Convolution

Semantic Segmentation

Design network as a bunch of convolutional layers, with **downsampling** and **upsampling** inside the network!

Input:
 $3 \times H \times W$

Downsampling:
Pooling, strided
convolution

Upsampling:
Unpooling or strided
transpose convolution

Predictions:
 $H \times W$
